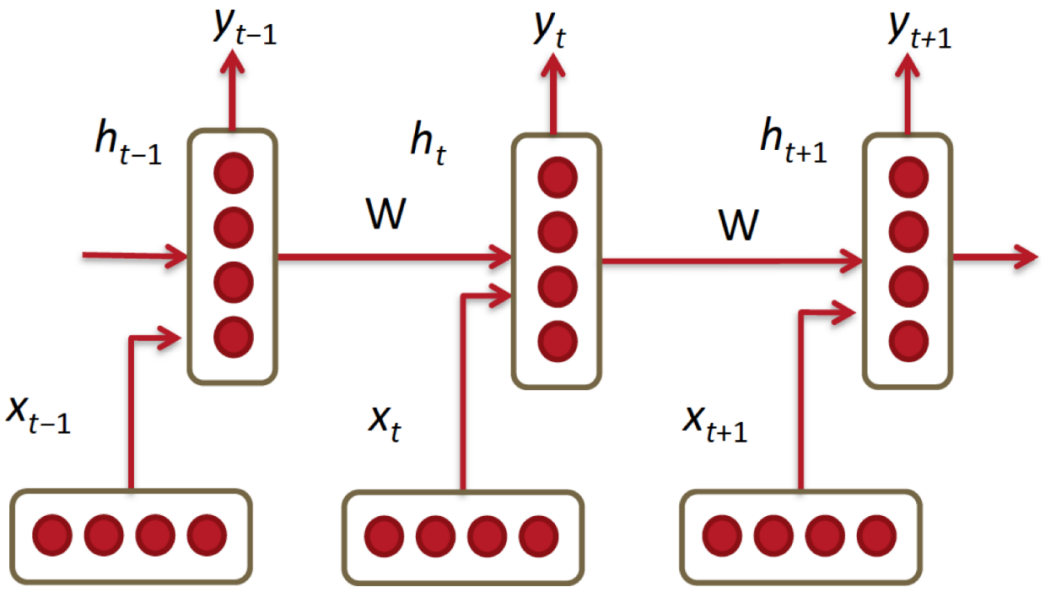
RNN Basics

Recurrent Neural Networks!

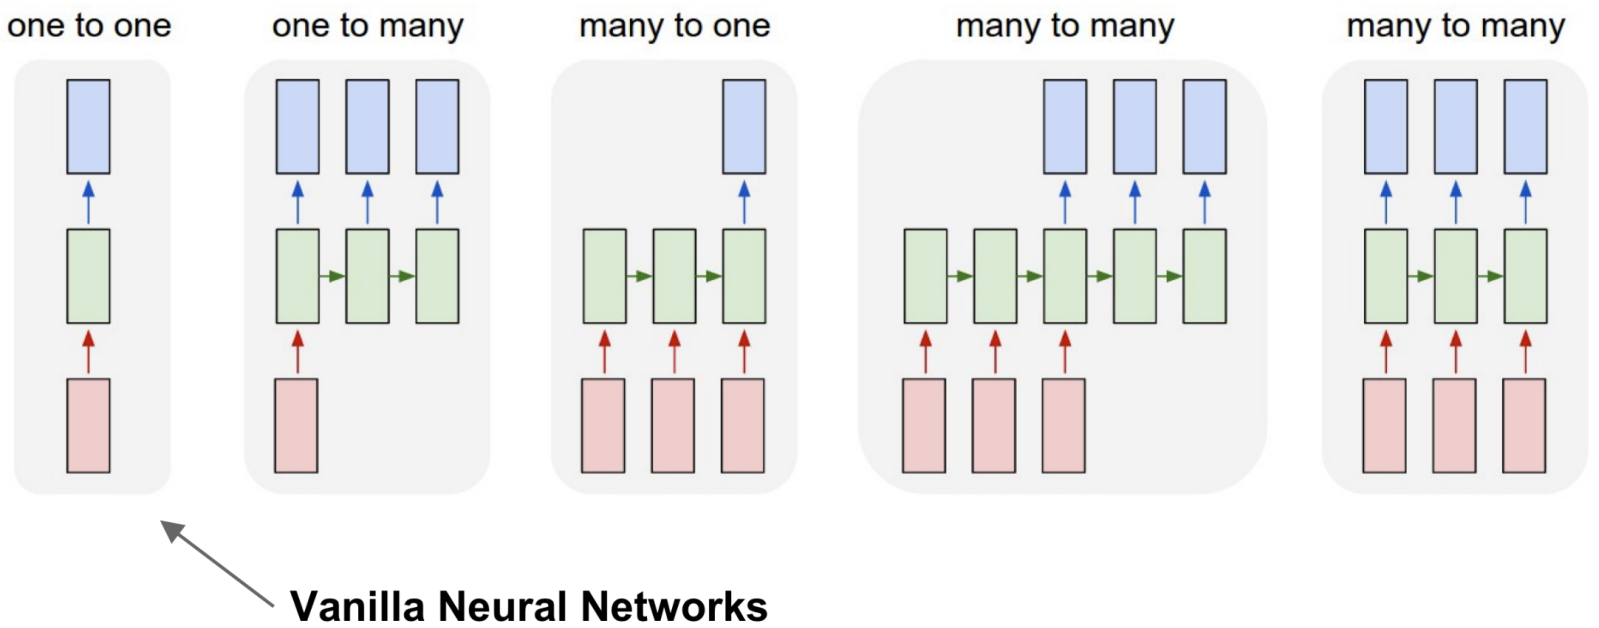


Richard Socher

- RNNs tie the weights at each time
- Condition the neural network on all previous words
- RAM requirement only scales with number of words

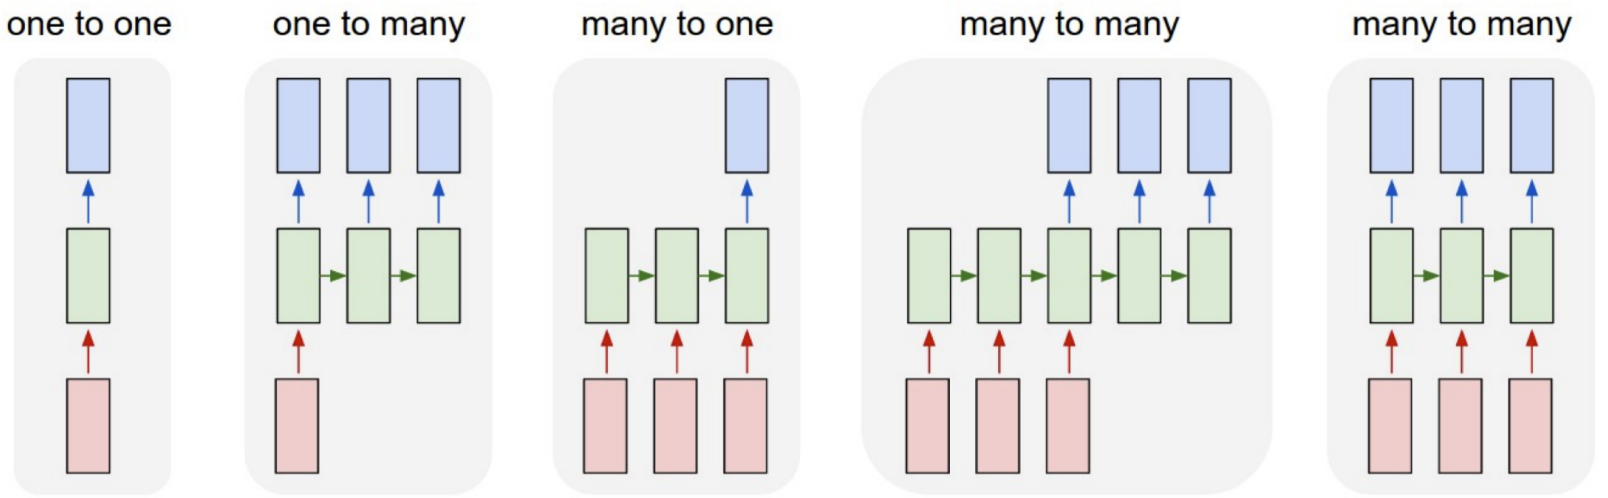
((Slide credit: cs224d)

RNN Basics



(Image credit: Karpathy's blog)

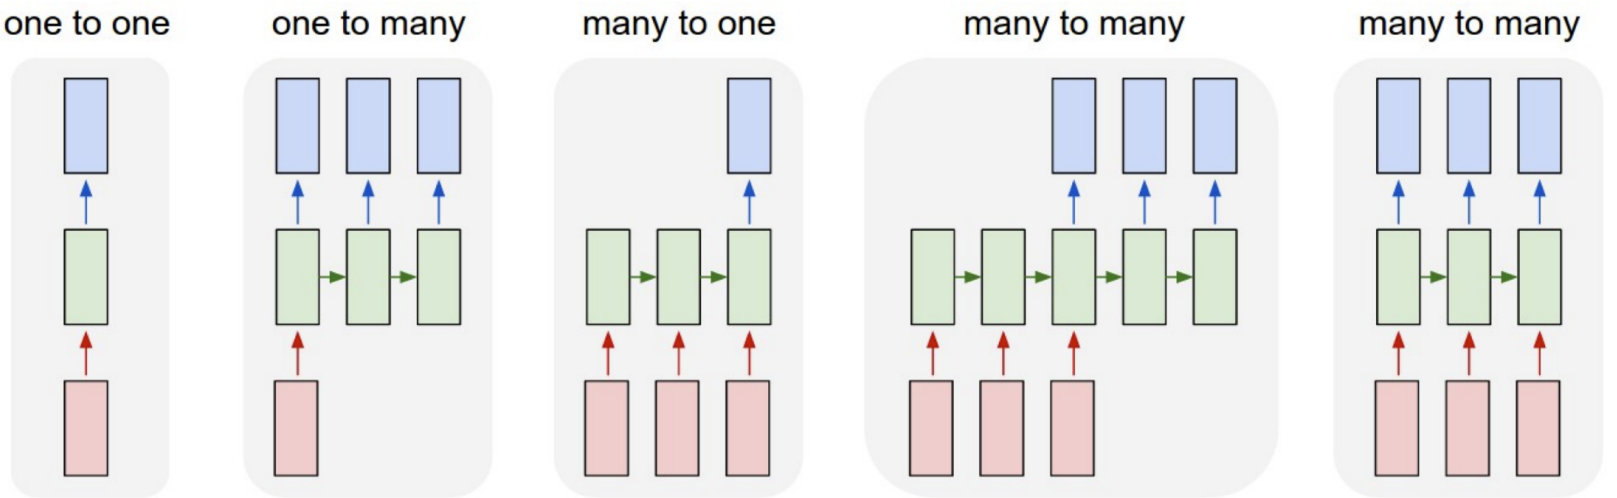
RNN Basics



e.g. **Image Captioning**
image -> sequence of words

(Image credit: Karpathy's blog)

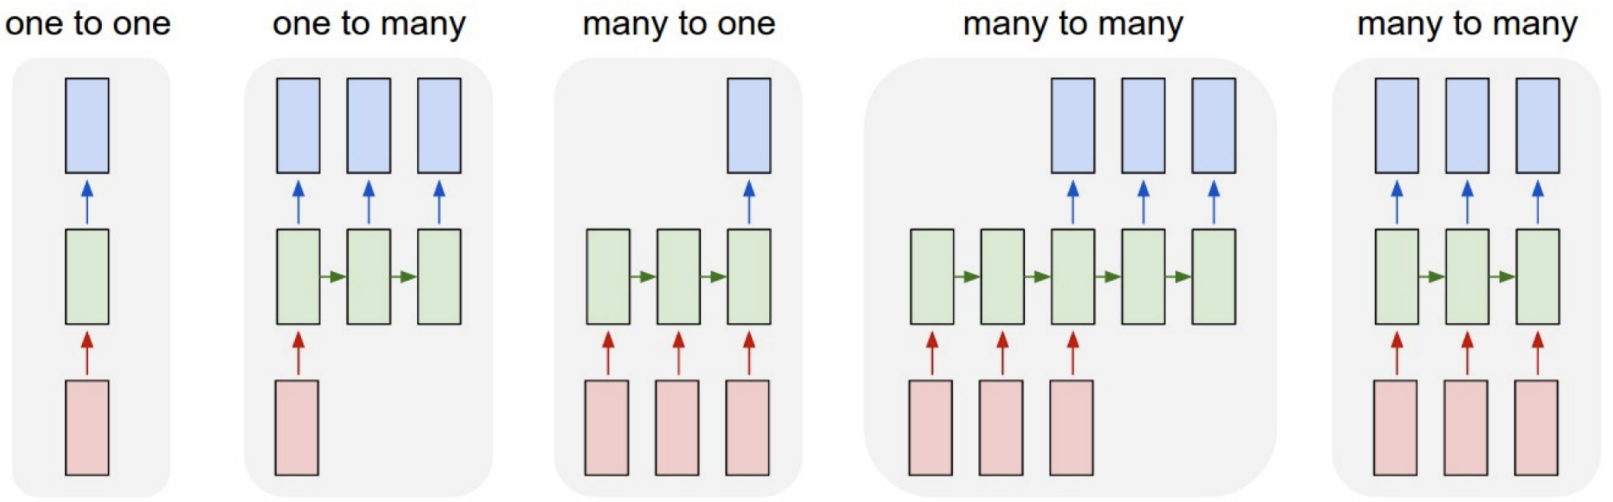
RNN Basics



e.g. **Sentiment Classification**
sequence of words -> sentiment

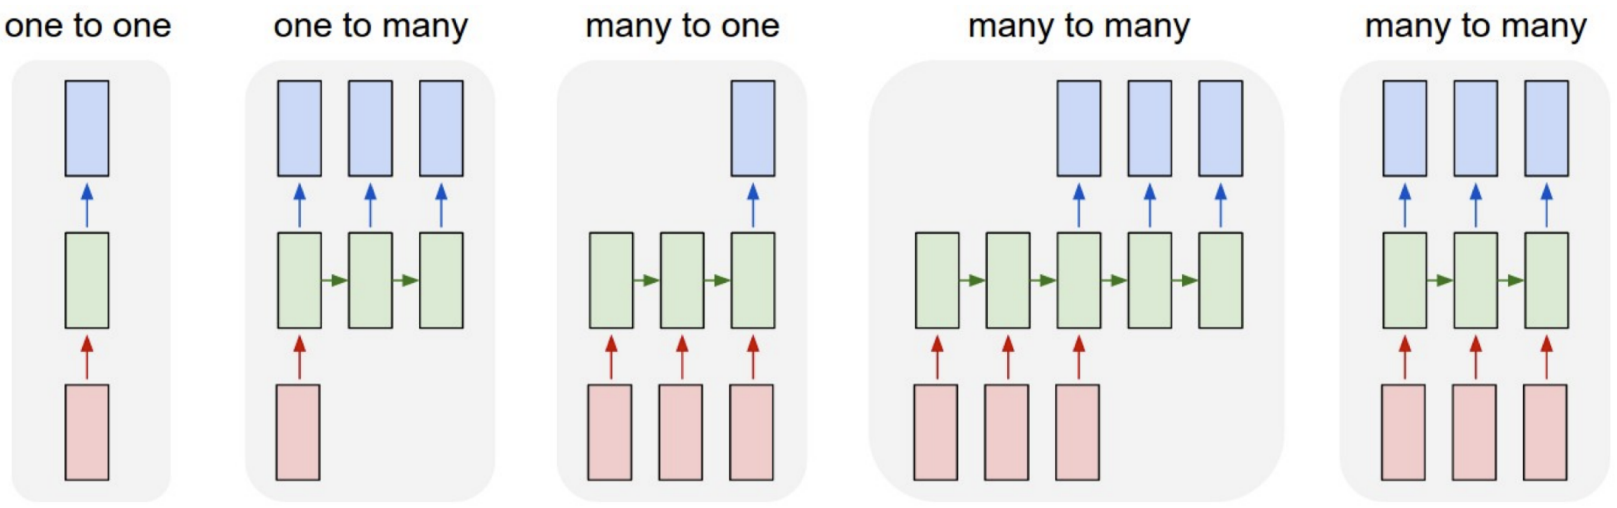
(Image credit: Karpathy's blog)

RNN Basics



(Image credit: Karpathy's blog)

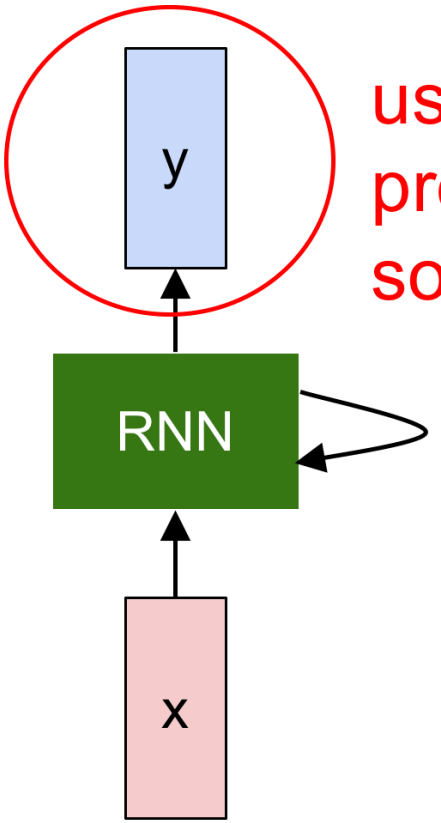
RNN Basics



e.g. **Video classification on frame level**

(Image credit: Karpathy's blog)

RNN Basics



usually want to predict a vector at some time steps

RNN Basics

We can process a sequence of vectors **x** by applying a recurrence formula at every time step:

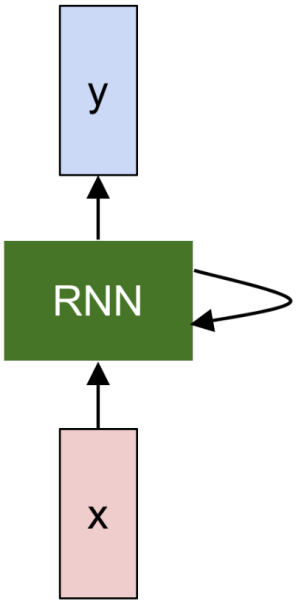
$$h_t = f_W(h_{t-1}, x_t)$$

new state

some function with parameters W

old state

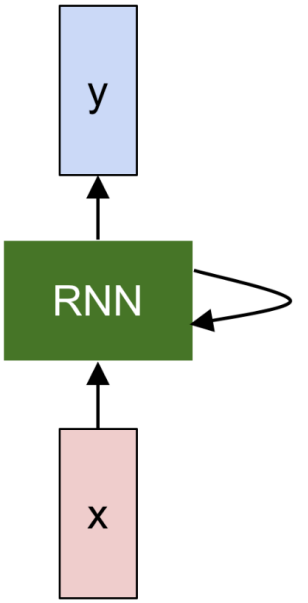
input vector at some time step



RNN Basics

We can process a sequence of vectors **x** by applying a recurrence formula at every time step:

$$h_t = f_W(h_{t-1}, x_t)$$



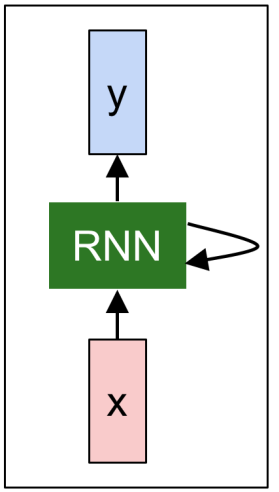
Notice: the same function and the same set of parameters are used at every time step.

RNN Basic

Character-level language model example

Vocabulary:
[h,e,l,o]

Example training sequence:
“hello”

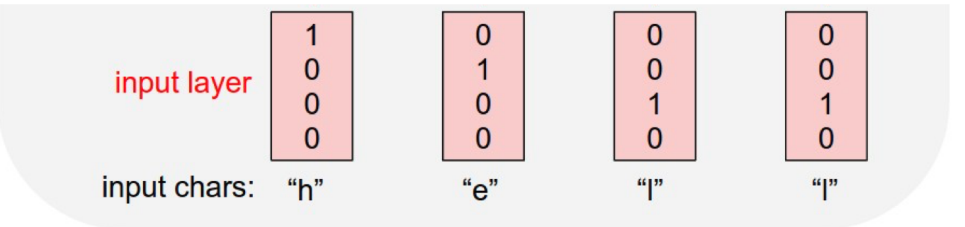


RNN Basic

Character-level language model example

Vocabulary:
[h,e,l,o]

Example training sequence:
“hello”



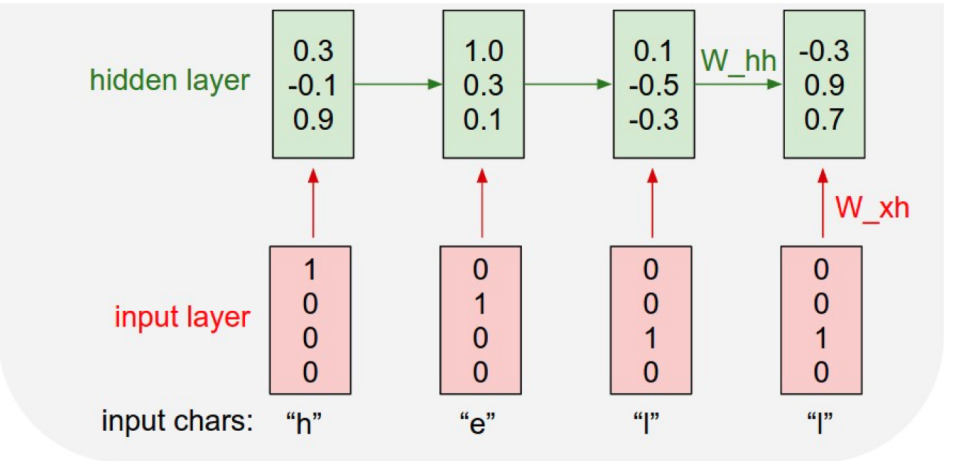
RNN Basic

Character-level language model example

Vocabulary:
[h,e,l,o]

Example training sequence:
“hello”

$$h_t = \tanh(W_{hh}h_{t-1} + W_{xh}x_t)$$



RNN Basic

Character-level language model example

Vocabulary:
[h,e,l,o]

Example training sequence:
“hello”

Time step and Batch

- Time steps are defined by **sequences length**
- The batch size is defined by **user**

Time major representation

- `[max_timestep * batch_size * dimension]`

RNNs typically use time major representation

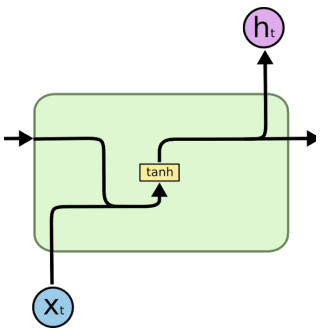
```
outputs = []
#Shape of sentences_in_batch [max_timestep * batch_size * dimension]
for words_in_batch in sentences_in_batch:
  # Shape of words_in_batch [batch_size * dimension]
  some operations here...
  outputs.append(i-th words_output)
#Shape of outputs [max_timestep * batch_size * dimension]
print outputs
```

RNN Cells (Memory Units)

- RNN basic code

```
outputs = []
#Shape of sentences_in_batch [max_timestep * batch_size * dimension]
for words_in_batch in sentences_in_batch:
  # Shape of words_in_batch [batch_size * dimension]
  some operations here...
  outputs.append(i-th words_output)
#Shape of outputs [max_timestep * batch_size * dimension]
print outputs
```

- RNN Cell

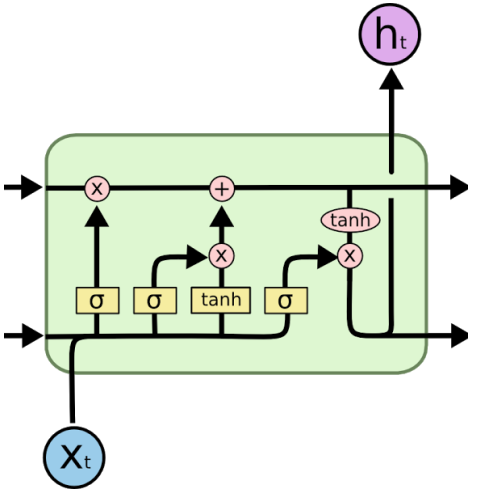


(Image credit: Colah's blog)

$$h_{t+1} = tanh(x_t W + h_t U + b)$$

RNN Cells (Memory Units)

- LSTM Cell

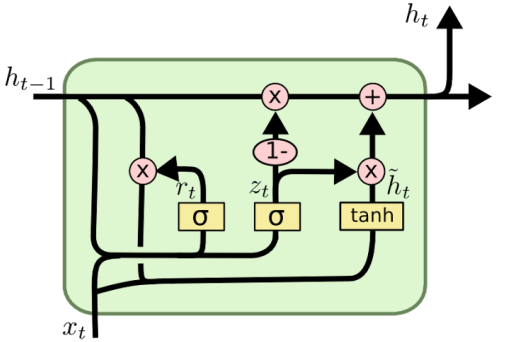


$$
\begin{aligned}
i &= \sigma(x_t U^i + s_{t-1} W^i) \\
f &= \sigma(x_t U^f + s_{t-1} W^f) \\
o &= \sigma(x_t U^o + s_{t-1} W^o) \\
g &= \tanh(x_t U^g + s_{t-1} W^g) \\
c_t &= c_{t-1} \circ f + g \circ i \\
s_t &= \tanh(c_t) \circ o
\end{aligned}
$$

(Image credit: Colah's blog)

RNN Cells (Memory Units)

- GRU Cell



$$
\begin{aligned}
z &= \sigma(x_t U^z + s_{t-1} W^z) \\
r &= \sigma(x_t U^r + s_{t-1} W^r) \\
h &= tanh(x_t U^h + (s_{t-1} \circ r) W^h) \\
s_t &= (1 - z) \circ h + z \circ s_{t-1}
\end{aligned}
$$

(Image credit: Colah's blog)

RNN Loss and Optimization

Simple RNN

$$
\begin{aligned}
s_t &= \tanh(Ux_t + Ws_{t-1}) \\
\hat{y}_t &= softmax(Vs_t)
\end{aligned}
$$

Cross Entropy Loss

$$
\begin{aligned}
E(y_t, \hat{y}_t) &= -y_t \log \hat{y}_t \\
E(y, \hat{y}) &= -\sum_t E_t(y_t, \hat{y}_t) \\
&= -\sum_t -y_t \log \hat{y}_t
\end{aligned}
$$

Tensorflow Basics

(1) Fetch tensors via `Session.run()`

```
x = tf.placeholder(tf.float32)
y = tf.placeholder(tf.float32)
bias = tf.Variable(1.0)

y_pred = x ** 2 + bias      # x -> x^2 + bias
loss = (y - y_pred)**2      # l2 loss?

# Error: to compute loss, y is required as a dependency
print('Loss(x,y) = %.3f' % session.run(loss, {x: 3.0}))

# OK, print 1.000 = (3**2 + 1 - 9)**2
print('Loss(x,y) = %.3f' % session.run(loss, {x: 3.0, y: 9.0}))
```

Tensorflow Basics

(2) Basic operations

```
'''Permuting batch_size and n_steps'''
x = tf.transpose(x, [1, 0, 2])

'''Reshape to (n_steps*batch_size, n_input)'''
x = tf.reshape(x, [-1, n_input])

'''Split to get a list of 'n_steps' tensors of shape (batch_size, n_input)'''
x = tf.split(x, n_steps, 0)

'''Matrix multiplication and bias addition'''
y = tf.matmul(outputs[-1], weights['out']) + biases['out']

'''Data type casting'''
correct_pred = tf.cast(correct_pred, tf.float32)

'''Calculate mean'''
correct_pred = tf.reduce_mean(correct_pred)

'''Adam optimizer''
tf.train.AdamOptimizer(learning_rate=learning_rate)
```

RNN Cells

Pre-defined class how to calculate the output

```
def call_cell(inputs, state):
  """Most basic RNN"""
  output = new_state = activation(W * input + U * state + B)
  return output
```

- tf.contrib.rnn.RNNCell()
- tf.contrib.rnn.LSTMCell()
- tf.contrib.rnn.GRUCell()

Where do I have to call `call_cell()`

```
outputs = []
for words_in_batch in sentences_in_batch:
  # Shape of words_in_batch [batch_size * dimension]
  some operations here...
  outputs.append(i-th words_output)
#Shape of outputs [max_timestep * batch_size * dimension]
print outputs
```

Using RNN wrapper

```
# Define a lstm cell with tensorflow
lstm_cell = rnn_cell.BasicLSTMCell(n_hidden, forget_bias=1.0)

# Get lstm cell output of RNN
outputs, states = rnn.static_rnn(lstm_cell, x)

# Get lstm cell output of BRNN
outputs, output_state_fw, output_state_bw = rnn.static_bidirectional_rnn(lstm_fw_cell, ls
```

RNN Loss

```
#Activation of the last fully connected layer
pred = tf.matmul(outputs[-1], weights['out']) + biases['out']

#Softmax cross entropy loss
#Internally calculate softmax
tf.nn.softmax_cross_entropy_with_logits(logits=pred, labels=y)
```

# Merge all summaries into a single op
merged_summary_op = tf.summary.merge_all()
```

Advanced

SEOUL NATIONAL UNIV.
VISION & LEARNING

Difficulty of training RNNs

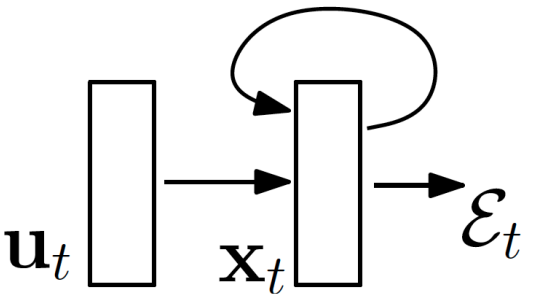

Fig. Schematic of a simple RNN

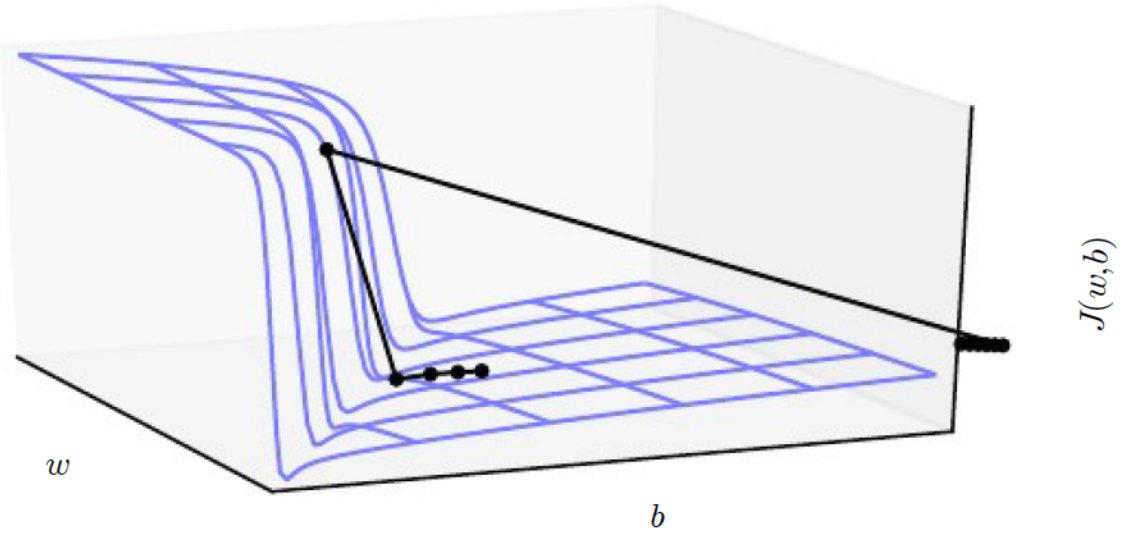
$$\mathbf{x}_t = F(\mathbf{x}_{t-1}, \mathbf{u}_t, \theta)$$
$$\mathbf{x}_t = \mathbf{W}_{rec}\sigma(\mathbf{x}_{t-1}) + \mathbf{W}_{in}\mathbf{u}_t + \mathbf{b}$$

Difficulty of training RNNs

- For RNN training, gradients can be exploding or vanishing.



Difficulty of training RNNs

Previous solutions

- Using L1 or L2 penalty on the recurrent weights
  - It can help exploding gradients, but not for vanishing.
  - This approach limits the model to a simple regime, where any information inserted in the model has to die out exponentially fast in time.
- Memory unit (ex LSTM or GRU)
  - This can help vanishing gradients.
  - This approach does not address explicitly the exploding gradients problem.

Difficulty of training RNNs

Gradient clipping

$$
\begin{aligned}
&\hat{\mathbf{g}} \leftarrow \frac{\partial \mathcal{E}}{\partial \theta} \\
&\textbf{if } \|\hat{\mathbf{g}}\| \geq threshold \textbf{ then} \\
&\quad \hat{\mathbf{g}} \leftarrow \frac{threshold}{\|\hat{\mathbf{g}}\|} \hat{\mathbf{g}} \\
&\textbf{end if}
\end{aligned}
$$

Alg. Gradient clipping

Simple mechanism to deal with a sudden increase in the norm of the gradients is to rescale them whenever they go over a threshold.

- In experiments, training is not very sensitive to this hyperparameter and the algorithm behaves well even for rather small thresholds.

Gradient Clipping

```
'''Don't use optimizer.minimize()'''

#Calculate gradients
grads = optimizer.compute_gradients(loss)

#Gradient Clipping
clipped_grads_and_vars = [(tf.clip_by_norm(gv[0], self.max_grad_norm), gv[1]) for gv in g

#Apply Gradient
optim = optimizer.apply_gradients(clipped_grads_and_vars, global_step=self.global_step)
```

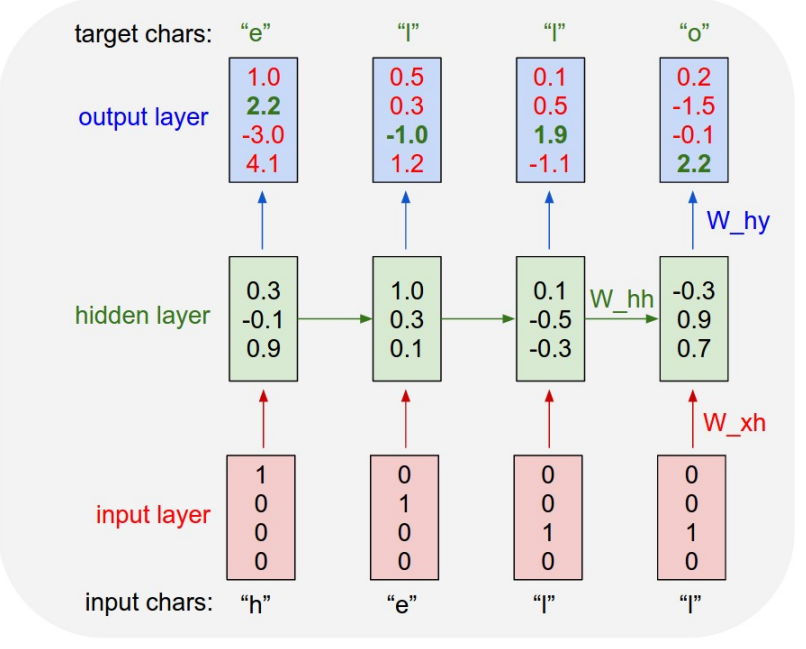
Practice : character Level RNN

3_char_rnn_train.ipynb, 3_char_rnn_inference.ipynb

SEOUL NATIONAL UNIV.
VISION & LEARNING

Algorithm mimics linux kernel code

- Char RNN architecture



- Train Linux kernel code
- RNN learns code pattern in character level

Reference:Tensorflow-101, Karpathy's blog

3_char_rnn_train.ipynb

- Load linux kernel code

```
# Load text
data_dir    = "data/linux_kernel"
save_dir    = "data/linux_kernel"
input_file  = os.path.join(data_dir, "input.txt")
with open(input_file, "r") as f:
    data = f.read()
print ("Text loaded from '%s'" % (input_file))
```

And preprocess text

```
# Preprocess Text
# First, count the number of characters
counter = collections.Counter(data)
count_pairs = sorted(counter.items(), key=lambda x: -x[1]) # <= Sort
print ("Type of 'counter.items()' is %s and length is %d"
       % (type(counter.items()), len(counter.items())))
for i in range(5):
    print ("[%d/%d]" % (i, 3)), # <= This comma remove '\n'
    print (list(counter.items())[i])

print (" ")
print ("Type of 'count_pairs' is %s and length is %d"
       % (type(count_pairs), len(count_pairs)))
for i in range(5):
    print ("[%d/%d]" % (i, 3)), # <= This comma remove '\n'
    print (count_pairs[i])
```

Make Dictionary and Vocabulary.

- Map Character to digit (index)

```
# Let's make dictionary
chars, counts = zip(*count_pairs)
vocab = dict(zip(chars, range(len(chars))))
print ("Type of 'chars' is %s and length is %d"
    % (type(chars), len(chars)))
for i in range(5):
    print ("[%d/%d]" % (i, 3)), # <= This comma remove '\n'
    print ("chars[%d] is '%s'" % (i, chars[i]))

print ("")

print ("Type of 'vocab' is %s and length is %d"
    % (type(vocab), len(vocab)))
for i in range(5):
    print ("[%d/%d]" % (i, 3)), # <= This comma remove '\n'
    print ("vocab['%s'] is %s" % (chars[i], vocab[chars[i]]))

# SAve chars and vocab
with open(os.path.join(save_dir, 'chars_vocab.pkl'), 'wb') as f:
    cPickle.dump((chars, vocab), f)
```

Make Dictionary and Vocabulary.

- Map Character to digit (index)

```
Type of 'chars' is <type 'tuple'> and length is 99
[0/3] chars[0] is ' '
[1/3] chars[1] is 'e'
[2/3] chars[2] is 't'
[3/3] chars[3] is 'r'
[4/3] chars[4] is 'i'

Type of 'vocab' is <type 'dict'> and length is 99
[0/3] vocab[' '] is 0
[1/3] vocab['e'] is 1
[2/3] vocab['t'] is 2
[3/3] vocab['r'] is 3
[4/3] vocab['i'] is 4
```

- Converts index to char

```
# Now convert all text to index using vocab!
corpus = np.array(list(map(vocab.get, data)))
print ("Type of 'corpus' is %s, shape is %s, and length is %d"
    % (type(corpus), corpus.shape, len(corpus)))

check_len = 10
print ("\n'corpus' looks like %s" % (corpus[0:check_len]))
for i in range(check_len):
    _wordidx = corpus[i]
    print ("[%d/%d] chars[%02d] corresponds to '%s'"
           % (i, check_len, _wordidx, chars[_wordidx]))
```

```
Type of 'corpus' is <type 'numpy.ndarray'>, shape is (1708871,), and length is 1708871

'corpus' looks like [36 22  7  0 22  0  0 13  4  8]
[0/10] chars[36] corresponds to '/'
[1/10] chars[22] corresponds to '*'
[2/10] chars[07] corresponds to '
```

Generate Batch data

```
# Generate batch data
batch_size  = 50
seq_length  = 200
num_batches = int(corpus.size / (batch_size * seq_length))
# First, reduce the length of corpus to fit batch_size
corpus_reduced = corpus[:(num_batches*batch_size*seq_length)]
xdata = corpus_reduced
ydata = np.copy(xdata)
ydata[:-1] = xdata[1:]
ydata[-1]  = xdata[0]
...
```

```
xdata is ... [36 22  7 ..., 11 25  3] and length is 1700000
ydata is ... [22  7  0 ..., 25  3 36] and length is 1700000

Type of 'xbatches' is <type 'list'> and length is 170
Type of 'ybatches' is <type 'list'> and length is 170

Type of 'temp' is <type 'list'> and length is 5
Type of 'temp[0]' is <type 'numpy.ndarray'> and shape is (50, 200)
```

Now, we are ready to make our RNN model

```
# Important RNN parameters
vocab_size = len(vocab)
rnn_size   = 128
num_layers = 2
grad_clip  = 5.

def unit_cell():
    return tf.contrib.rnn.BasicLSTMCell(rnn_size,state_is_tuple=True,reuse=tf.get_variabl

- Latex generation. The resulting sampled Latex almost compiles.

Proof. Omitted. □

Lemma 0.1. *Let $\mathcal{C}$ be a set of the construction.*

Let $\mathcal{C}$ be a gerber covering. Let $\mathcal{F}$ be a quasi-coherent sheaves of $\mathcal{O}$-modules. We have to show that

$$\mathcal{O}_{\mathcal{O}_X} = \mathcal{O}_X(\mathcal{L})$$

.

Proof. This is an algebraic space with the composition of sheaves $\mathcal{F}$ on $X_{\acute{e}tale}$ we have

$$\mathcal{O}_X(\mathcal{F}) = \{morph_1 \times_{\mathcal{O}_X} (\mathcal{G}, \mathcal{F})\}$$

where $\mathcal{G}$ defines an isomorphism $\mathcal{F} \to \mathcal{F}$ of $\mathcal{O}$-modules. □

Lemma 0.2. *This is an integer $\mathcal{Z}$ is injective.*

Proof. See Spaces, Lemma ??. □

Lemma 0.3. *Let S be a scheme. Let X be a scheme and X is an affine open covering. Let $\mathcal{U} \subset \mathcal{X}$ be a canonical and locally of finite type. Let X be a scheme. Let X be a scheme which is equal to the formal complex.*

The following to the construction of the lemma follows.

Let X be a scheme. Let X be a scheme covering. Let

$$b : X \to Y' \to Y \to Y \to Y' \times_X Y \to X.$$

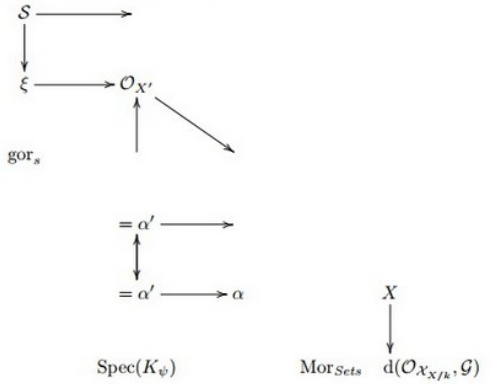
be a morphism of algebraic spaces over S and Y.

Proof. Let X be a nonzero scheme of X. Let X be an algebraic space. Let $\mathcal{F}$ be a quasi-coherent sheaf of $\mathcal{O}_X$-modules. The following are equivalent

(1) $\mathcal{F}$ is an algebraic space over S.
(2) If X is an affine open covering.

Consider a common structure on X and X the functor $\mathcal{O}_X(U)$ which is locally of finite type. □

This since $\mathcal{F} \in \mathcal{F}$ and $x \in \mathcal{G}$ the diagram



is a limit. Then $\mathcal{G}$ is a finite type and assume S is a flat and $\mathcal{F}$ and $\mathcal{G}$ is a finite type $f_\star$. This is of finite type diagrams, and

- the composition of $\mathcal{G}$ is a regular sequence,
- $\mathcal{O}_{X'}$ is a sheaf of rings.

□

Proof. We have see that $X = \mathrm{Spec}(R)$ and $\mathcal{F}$ is a finite type representable by algebraic space. The property $\mathcal{F}$ is a finite morphism of algebraic stacks. Then the cohomology of X is an open neighbourhood of U. □

Proof. This is clear that $\mathcal{G}$ is a finite presentation, see Lemmas ??.
A *reduced above* we conclude that U is an open covering of $\mathcal{C}$. The functor $\mathcal{F}$ is a "field

$$\mathcal{O}_{X,x} \longrightarrow \mathcal{F}_{\overline{x}} \quad \text{-1}(\mathcal{O}_{X_{\acute{e}tale}}) \longrightarrow \mathcal{O}_{X_t}^{-1}\mathcal{O}_{X_\lambda}(\mathcal{O}_{X_\eta}^{\overline{v}})$$

is an isomorphism of covering of $\mathcal{O}_{X_i}$. If $\mathcal{F}$ is the unique element of $\mathcal{F}$ such that X is an isomorphism.
The property $\mathcal{F}$ is a disjoint union of Proposition ?? and we can filtered set of presentations of a scheme $\mathcal{O}_X$-algebra with $\mathcal{F}$ are opens of finite type over S.
If $\mathcal{F}$ is a scheme theoretic image points. □

If $\mathcal{F}$ is a finite direct sum $\mathcal{O}_{X_\lambda}$ is a closed immersion, see Lemma ??. This is a sequence of $\mathcal{F}$ is a similar morphism.

(Image credit: Karpathy's blog)

More results

- Latex generation. The resulting sampled Latex almost compiles.

For $\bigoplus_{n=1,\ldots,m}$ where $\mathcal{L}_{m_\bullet} = 0$, hence we can find a closed subset $\mathcal{H}$ in $\mathcal{H}$ and any sets $\mathcal{F}$ on X, U is a closed immersion of S, then $U \to T$ is a separated algebraic space.

Proof. Proof of (1). It also start we get

$$S = \mathrm{Spec}(R) = U \times_X U \times_X U$$

and the compariciely in the fibre product covering we have to prove the lemma generated by $\coprod Z \times_U U \to V$. Consider the maps M along the set of points Sch_{fppf} and $U \to U$ is the fibre category of S in U in Section, **??** and the fact that any U affine, see Morphisms, Lemma **??**. Hence we obtain a scheme S and any open subset $W \subset U$ in $Sh(G)$ such that $\mathrm{Spec}(R') \to S$ is smooth or an

$$U = \bigcup U_i \times_{S_i} U_i$$

which has a nonzero morphism we may assume that f_i is of finite presentation over S. We claim that $\mathcal{O}_{X,x}$ is a scheme where $x, x', s'' \in S'$ such that $\mathcal{O}_{X,x'} \to \mathcal{O}'_{X',x'}$ is separated. By Algebra, Lemma **??** we can define a map of complexes $\mathrm{GL}_{S'}(x'/S'')$ and we win. □

To prove study we see that $\mathcal{F}|_U$ is a covering of $\mathcal{X}'$, and $\mathcal{T}_i$ is an object of $\mathcal{F}_{X/S}$ for $i > 0$ and $\mathcal{F}_p$ exists and let $\mathcal{F}_i$ be a presheaf of $\mathcal{O}_X$-modules on $\mathcal{C}$ as a $\mathcal{F}$-module. In particular $\mathcal{F} = U/\mathcal{F}$ we have to show that

$$\widetilde{M}^\bullet = \mathcal{I}^\bullet \otimes_{\mathrm{Spec}(k)} \mathcal{O}_{S,s} - i_X^{-1}\mathcal{F})$$

is a unique morphism of algebraic stacks. Note that

$$\mathrm{Arrows} = (Sch/S)^{opp}_{fppf}, (Sch/S)_{fppf}$$

and

$$V = \Gamma(S, \mathcal{O}) \longmapsto (U, \mathrm{Spec}(A))$$

is an open subset of X. Thus U is affine. This is a continuous map of X is the inverse, the groupoid scheme S.

Proof. See discussion of sheaves of sets. □

The result for prove any open covering follows from the less of Example **??**. It may replace S by $X_{spaces,étale}$ which gives an open subspace of X and T equal to S_{Zar}, see Descent, Lemma **??**. Namely, by Lemma **??** we see that R is geometrically regular over S.

Lemma 0.1. *Assume (3) and (3) by the construction in the description.*

Suppose $X = \lim |X|$ *(by the formal open covering* X *and a single map* $\underline{Proj}_X(\mathcal{A}) = \mathrm{Spec}(B)$ *over* U *compatible with the complex*

$$Set(\mathcal{A}) = \Gamma(X, \mathcal{O}_{X,\mathcal{O}_X}).$$

When in this case of to show that $\mathcal{Q} \to \mathcal{C}_{Z/X}$ *is stable under the following result in the second conditions of (1), and (3). This finishes the proof. By Definition* **??** *(without element is when the closed subschemes are catenary. If* T *is surjective we may assume that* T *is connected with residue fields of* S*. Moreover there exists a closed subspace* $Z \subset X$ *of* X *where* U *in* X' *is proper (some defining as a closed subset of the uniqueness it suffices to check the fact that the following theorem*

(1) f *is locally of finite type. Since* $S = \mathrm{Spec}(R)$ *and* $Y = \mathrm{Spec}(R)$.

Proof. This is form all sheaves of sheaves on X. But given a scheme U and a surjective étale morphism $U \to X$. Let $U \cap U = \coprod_{i=1,\ldots,n} U_i$ be the scheme X over S at the schemes $X_i \to X$ and $U = \lim_i X_i$. □

The following lemma surjective restrocomposes of this implies that $\mathcal{F}_{x_0} = \mathcal{F}_{x_0} = \mathcal{F}_{\mathcal{X},\ldots,0}$.

Lemma 0.2. *Let* X *be a locally Noetherian scheme over* S, $E = \mathcal{F}_{X/S}$. *Set* $\mathcal{I} = \mathcal{J}_1 \subset \mathcal{I}'_n$. *Since* $\mathcal{I}^n \subset \mathcal{I}^n$ *are nonzero over* $i_0 \leq \mathfrak{p}$ *is a subset of* $\mathcal{J}_{n,0} \circ \overline{A}_2$ *works.*

Lemma 0.3. *In Situation* **??**. *Hence we may assume* $\mathfrak{q}' = 0$.

Proof. We will use the property we see that $\mathfrak{p}$ is the mext functor (**??**). On the other hand, by Lemma **??** we see that

$$D(\mathcal{O}_{X'}) = \mathcal{O}_X(D)$$

where K is an F-algebra where δ_{n+1} is a scheme over S. □

Try other corpus!

- Set corpus_name variable to 'nine_dreams' dataset.
  - Both train and inference scripts.
- Let's download any text data and try to train RNN!
- Larger corpus gives better result. But training time is much longer.

Inference Result - nine_dreams

- Epoch 99000

```
오늘 미엿한 즉기고치를 면파지 못하고 마침께 수량궁처래마마)에
분행하니 부처님께서는 소유가 시녀 들어가 재주를
만나니 말을 건골이도, 양한림의 천재 다만의 암을 물함과 세 살이 술있다 남이
금강제의 슬픔을 떨치어 꽃고 진생을 따라가섰다.
  "시비 크게 연화봉으로 돌아와 감화록 선비의 소설해지고 이 노후의 공중을 서서함이 도적을 치었다.
  양한림이 칵을 수 일면서 의심하였나이다."
  양원수가 들으려 다시 중에서는 내전하를 부적없이를 언제하여 계랑과 더불어 딸이 들와 돌아밡히 여찌하고
꾸짖어서 펴로 어떱게 여겨 공경에 지방 읊으셨으니 어찌(삼 되는 말이옵니까?"
  이를 경공자들이 참은케 눌러져기 크리리오?"
  하고, 이곳으로벼 생각하며 눈우면제신 1틍해 배색가룰맘이 어찌 위남여 도리에서는
크게 궁기쁜 두 구성과 더불어 가처를 감추고
있었다.
  두 시뱅과 정소저, 전교, 조정이 백릉 둘이 궁경에는 아생과 더불어
가하로자 생각하시기에 낭자가 이미 족자리로 보여 있는데 손을 잡시 명세코 별 한 손)을 듣고노며,
한림은 여중 곹오는 사음에 침녀 무매로다 인사들이 대사께 돌아가도록 하라."
  이 아가서는 새 돛아오니, 어찌 가히 변천학장, 해로다."
  하는데, 전일에 용명을 튼 보해하며 가약을 이루거늘 말하기
대부인을 목안하샀던 것에 그 뮤은 꿇어였다.
